

Andon Systems

Spaceguard workstation signalling products are designed and installed to improve efficiency. Our Lean production signalling solutions help reduce downtime, improve productivity and free capacity. Spaceguard offers low cost simple solutions for lean processes.

We can manufacture and supply a range of Andon systems that can be either part of a new workstation, a standalone post mounted system or a modification which can work with existing workbenches

What are Andon Systems

Andon Systems originates in Japan. A signal tower mounted in a prominent position signals that a specific problem has arisen and requests an immediate response.

Spaceguard's manual call systems function according to the same principle: when an optical is illuminated the supervisor or employee is made aware of the fact that an immediate response is required. Each workstation that is equipped with these products enables an employee to precisely and instantaneously signal which type of issue has occurred at the touch of a button. So the information can be acted on and potential downtime eliminated or reduced.

Manual Call system

The Implementation of manual call systems (Andon products) are used within production and packaging processes to eliminate time waste within process. This creates real value, cost savings and increasing productivity along with improving overall flexibility.
